These well established F-2 strains have now proven their great worth to the industry under many and varying conditions. An F-2 tomato is the second generation of an F-1 hybrid. There are many advantages of an F-2 over the conventional open-pollinated types. They will have a longer harvest, a higher yield per acre, and in many instances have greater resistance to disease and to cracking.

**STOKESCROSS No. 1**—70 days. This sets readily on a vine approximating that of Rutgers. The fruit size is in the normal 6 oz. range. The important factors of Stokes-cross No. 1, include early setting and the ability to yield heavily throughout the season. It is recommended for greenwrap, for vine ripened, and for processing.

**STOKESCROSS No. 4**—75 days. The vine is lighter than Rutgers. Fruit size is in the normal 5 oz. range. It sets readily and has a fast maturity. It is especially recommended for the shorter season areas, the northern tier states, and Canada.

**STOKESCROSS No. 5**—77 days. Fruit range 5 to 6 ozs. The foliage is fully equal to Rutgers. We do not recommend heavy nitrogen applications until the main set is established. Stokescross No. 5 has proven its place as a distinguished all purpose tomato, either for the fresh market or for the canner. It has a long harvest and will maintain its quality throughout the season.

**STOKESCROSS No. 6**—78 days. On a quality basis, Stokescross No. 6 out-points any tomato our company has introduced in 75 years. Its outstanding factors include resistance to Fusarium and to cracking. Stokescross No. 6 requires a full season for maturity, and will keep bearing until frost with healthy vine and with an interior that is of the highest quality. Plant in 6 ft. rows.

Stokes is the largest producer of F-2 tomato seed in the United States.
